WINTER HEATING FIRE SAFETY TIPS FOR THE HOME

The high cost of home heating fuels and utilities have caused many Americans to search for alternative sources of home heating. The use of wood burning stoves is growing and space heaters are selling rapidly, or coming out of storage. Fireplaces are burning wood and man-made logs.

All these methods of heating may be acceptable. They are, however, a major contributing factor in residential fires. Many of these fires can be prevented. The following fire safety tips can help you maintain a fire safe home this winter.

KEROSENE HEATERS

- Be sure your heater is in good working condition. Inspect exhaust parts for carbon buildup. Be sure the heater has an emergency shut off in case the heater is tipped over.
- Never use fuel burning appliances without proper room venting. Burning fuel (coal, kerosene, or propane, for example) can produce deadly fumes.
- Use ONLY the fuel recommended by the heater manufacturer. NEVER introduce a fuel into a unit not designated for that type of fuel.
- Keep kerosene, or other flammable liquids stored in approved metal containers, in well ventilated storage areas, outside of the house.
- NEVER fill the heater while it is operating or hot. When refueling an oil or kerosene unit avoid overfilling. DO NOT use cold fuel for it may expand as the tank warms up.
- Refueling should be done outside of the home (or outdoors). Keep young children away from space heaters—especially when they are wearing night gowns or other loose clothing that can be easily ignited.
- When using a fuel burning appliance in the bedroom, be sure there is proper ventilation to prevent a build-up of carbon monoxide.

WOOD STOVE AND FIREPLACES

Wood stoves and fireplaces are becoming a very common heat source in homes. Careful attention to safety can minimize this fire hazard.

To use them safely:

- Be sure the fireplace or stove is installed properly. Wood stoves should have adequate clearance (36") from combustible surfaces and proper floor support and protection.
- Wood stoves should be of good quality, solid construction and design, and should be UL listed.
- Have the chimney inspected annually and cleaned if necessary, especially if it has not been used for some time.
- Do not use flammable liquids to start or accelerate any fire.
- Keep a glass or metal screen in front of the fireplace opening, to prevent embers or sparks from jumping out, unwanted material from going in, and prevent the possibility of burns to occupants.
- The stove should be burned hot twice a day for 15-30 minutes to reduce the amount of creosote build-up.
- Don’t use excessive amounts of paper to build roaring fires in fireplaces. It is possible to ignite creosote in the chimney by overbuilding the fire.
- Never burn charcoal indoors. Burning charcoal can give off lethal amounts of carbon monoxide.
- Keep flammable materials away from your fireplace mantel. A spark from the fireplace could easily ignite these materials.
• Before you go to sleep, be sure your fireplace fire is out. **NEVER close your damper with hot ashes in the fireplace.** A closed damper will help the fire to heat up again and will force toxic carbon monoxide into the house.
• If synthetic logs are used, follow the directions on the package. **NEVER break a synthetic log apart to quicken the fire or use more than one log at a time.** They often burn unevenly, releasing higher levels of carbon monoxide.

**ELECTRIC SPACE HEATERS**
• Be sure not to overload the circuit and using extensions cords which have the necessary rating to carry an amp load. Tip: choose an extension cord the same size or larger than the appliance electrical cord.
• Check to make sure that it has a thermostat and will cut off automatically if it falls over.
• Do not use as a dryer or table—don’t dry clothes or store objects on top of your heater.
• Give space heaters space. **Keep combustibles at least three feet away.** Avoid using electrical space heaters in areas where they may come in contact with water.

**FURNACE HEATING**
It is important that you have your furnace inspected to ensure that it is in good working condition.
• Be sure all furnace controls and emergency shutoffs are in proper working condition.
• Leave furnace repairs to qualified specialists. Do not attempt any repairs yourself unless you are qualified.
• Inspect the walls and ceiling near the furnace and along the chimney liner. If the wall is hot or discolored, additional pipe insulation or clearance may be required.
• Check the flue pipe and pipe seams. Are they well supported and free of holes and cracks? Soot along or around seams may be an indicator of a leak.
• Is the chimney solid, with cracks or loose bricks? All unused flue openings should be sealed with solid masonry.
• Keep trash and other combustibles away from the heating system.

**OTHER FIRE SAFETY TIPS**
• Never discard hot ashes inside or near the home. Place them in a metal container outside and well away from the house.
• Never use a range or an oven as a supplemental heating device. Not only is it a safety hazard, it can be a source of potentially toxic fumes.
• Frozen water pipes? Never try to thaw them with a blow torch or other open flame, otherwise the pipe could conduct the heat and ignite the wall structure inside the wall space. Use hot water or a UL-labeled device such as a hand held dryer for thawing.
• If windows are used as emergency exits in your home, practice using them in the event fire should strike. Be sure that all windows open easily. Home escape ladders are recommended.
• If there is a fire hydrant near your home you can assist the fire department by keeping the hydrant clear of snow so in the event it is needed, it can be located.

**FINALLY...**
• Be sure every level of your home has a working smoke alarm, and be sure to check and clean it on a monthly basis.
• Plan and practice a home escape plan with your family.
• A Carbon Monoxide detector is a must when using fuel fired appliances.
• Contact your local fire department for advice if you have a question on home fire safety.
